Part A (10 points) Design a toggle cell using two transparent latches, two 2 to 1 muxes, and one inverter. Your toggle cell should have an active high toggle enable input TE, and an active low clear input -Clear, clock inputs $\Phi_{1}$ and $\Phi_{2}$, and an output Out. The -Clear signal has precedence over TE. Label all signals. Also complete the behavior table for the toggle cell.

Part B (12 points) Now combine these toggle cells to build a divide by six counter. Your counter should have an external clear, external count enable, and three count outputs $\mathrm{O}_{2}, \mathrm{O}_{1}, \mathrm{O}_{0}$. Use any basic gates (AND, OR, NAND, NOR, \& NOT) you require. Assume clock inputs to the toggle cells are already connected. Your design must support multi-digit systems.

Problem 2 (3 parts, 30 points)
Memory Systems
Part A (12 points) Consider a 256 Mbit DRAM chip organized as 32 million addresses of eight bit words. Assume both the DRAM cell and the DRAM chip are square. The column number and offset concatenate to form the memory address. Using the organization approach discussed in class, answer the following questions about the chip. Express all answers in decimal (not powers of two).

| number of columns | $\operatorname{sqrt}\left(2^{28}\right)=2^{14}=16 \mathrm{~K}$ |
| :---: | :---: |
| number of words per column | $2^{14} / 2^{3}=2^{11}=2 K$ |
| column decoder required ( $n$ to $m$ ) | 14 to 16K |
| type of mux required ( $n$ to m) | 2 K to 1 |
| number of address lines in column number | 14 |
| number of address lines in column offset | 11 |

Part B (10 points) Consider a one gigabyte memory system with 128 million addresses of $\mathbf{8}$ byte words using a 32 million address by $\mathbf{8}$ bit word memory DRAM chip.

| word address lines for memory system | $\log _{2}(128 M)=27$ |
| :---: | :---: |
| chips needed in one bank | 8 bytes $\times 2^{3}$ bits $/$ byte $/ 8$ bits $=8$ |
| banks for memory system | $128 M / 32 M=2^{27} / 2^{25}=4$ |
| memory decoder required $(n$ to $m)$ | 2 to 4 |
| DRAM chips required |  |

Part C ( 8 points) Design a 128 million address by 8 bit memory system with four 64 M x 4 memory chips. Label all busses and indicate bit width. Assume R/W is connected and not shown here. Use a bank decoder if necessary.

Problem 3 (3 parts, 22 points)
Datapath Elements and Instruction Formats
Part A (6 points) Suppose the following inputs (in hexadecimal) are applied to the 32-bit barrel shifter used in the datapath. Determine the output (in hexadecimal). Assume the shift amount (given in hexadecimal) is drawn from the 16 -bit immediate value.

| Shift Type | Shift Amount | Input Value | Output Value |
| :---: | :---: | :---: | :---: |
| logical | FFF0 | 12345678 | 56780000 |
| arithmetic | 0014 | A1024562 | FFFFFA10 |
| rotate $^{1}$ | $000 C$ | F4A11BEE | BEEF4A11 |

Part B (8 points) For each bitwise logical function specification below, determine the LF code (in hexadecimal) to correctly program the logical unit.

| X | Y | Out |
| :---: | :---: | :---: |
| 0 | 0 | $\mathrm{LF}_{0}$ |
| 1 | 0 | $\mathrm{LF}_{1}$ |
| 0 | 1 | $\mathrm{LF}_{2}$ |
| 1 | 1 | $\mathrm{LF}_{3}$ |

| logical function | LF |
| :---: | :---: |
| $\overline{X \oplus Y}$ | 9 |
| $X \cdot \bar{Y}$ | 2 |
| $X+Y$ | E |
| 1 | F |

Part C (8 points) For the state machine below, determine the output given the input and current register output for that cycle. Assume the register output is 0 (low) during the first cycle.

| cycle | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| In | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 1 | 1 |
| Out | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 |

[^0]Problem 4 (2 parts, 26 points)
Microcode
Using the supplied datapath, write microcode fragments to accomplish the following procedures. Express all values in hexadecimal notation. Use ' X ' when a value is don't cared. For maximum credit, complete the description field.
Part A (13 points) $\quad R_{4}=\frac{R_{1}-\left(R_{2} \times 5\right)}{2}-R_{3} \quad$ Use only $\mathbf{R}_{\mathbf{1}}-\mathbf{R}_{4}$; modify only $\mathbf{R}_{\mathbf{4}}$.

Part B (13 points) Write a microcode sequence that sums three packed ten bit values red, green, and blue of $\mathrm{R}_{1}$ (format shown below). Assume the most significant two bits of the register are zero. Place the sum of the unpacked red, green, and blue values in $R_{2}$. Use only $\mathbf{R}_{1}, \mathbf{R}_{2}$, and $R_{3}$; modify only $R_{2}$ and $R_{3}$.
