ECE2020 Test 1 Summer 2014 GTL
June 4, 2014
Name:
KEY
6 pages, 100 possible points. Show your work for any possible partial credit. No calculators, no cell phones allowed.

Switch Level Circuits:

1) ( 15 total point) For the expression below, create a switch level implementation using $N$ and $P$ type switches. Assume both inputs and their complements are available. Your design should contain no shorts or floats. Implement the equations exactly as they are (no simplifying).

Out $_{\mathrm{x}}=(\mathrm{A} \cdot \overline{\mathrm{B}} \cdot \mathrm{C}+\overline{\mathrm{D}} \cdot \mathrm{E}) \overline{\mathrm{F}}+\mathrm{G}$

Switch-Ready Expressions:
2) (15 points) Transform each of the following Boolean expressions to a form where they are ready for switch level implementation (i.e., there should only be bars over input variables, not over operations). The behavior of the expression should remain unchanged. Do not implement, just show the new Boolean equation without any "big bars". (Note: The line above the boolean equation is a bar and is not a blank for you to write an answer in).

$$
\begin{aligned}
\text { Outx }= & \overline{\overline{(D \cdot E+F \cdot G) \cdot \bar{H}}+\overline{I \cdot J}} \\
& \overline{\overline{((D \cdot E)+(F \cdot G)}+\overline{\bar{H}}}+\overline{\overline{\bar{I}+\bar{J}}} \\
& \overline{\overline{(D \cdot E)+(F \cdot G)}+H+\bar{I}+\bar{J}} \\
& \overline{(D \cdot E) \cdot(\overline{F \cdot G})}+H+\overline{(D \cdot E)(\overline{F \cdot G})}+H+\bar{J} \\
& \overline{\overline{(\bar{D}+\bar{E})}(\overline{\bar{F}+\bar{G})}+H+\bar{J}} \\
& (\overline{\bar{D}+\bar{E})(\bar{F}+G)+H+\bar{J}+\bar{J}}
\end{aligned}
$$

| Instruction Set |  |  |
| Memory | Data Path | Controller |
| Storage | Functional <br> Units | State <br> Machines |
| Building Blocks |  |  |
| Gates |  |  |

3) ( 15 points) Write the boolean output expression for the gate design shown below. Also determine the number of switches used in its implementation.

Out $\square$
$(A+\bar{B}+C)(\overline{D \cdot F}+G) \cdot H$
number of switches $\qquad$ $6 \times 4+8 \times 2=40$

| Storage | Functional <br> Units | State <br> Machines |
| Building Blocks |  |  |
| Gates |  |  |
| Switches and Wires |  |  |

4) ( 15 points) Implement the following expression using only two input AND gates and inverters so as to minimize the number of switches required. Then determine the number of switches required. Use proper mixed logic notation. Do not modify the expression, do not simplify the expression. Do not assume complements of inputs are available.

Out $=(\overline{\mathrm{A}} \cdot \overline{\mathrm{B}}+\mathrm{C})+\overline{(\overline{\mathrm{D} \cdot \mathrm{E}}+\mathrm{F})}$

Number of switches $\quad 5 \times 6+7 \times 2=44$

5) ( 15 points) Determine the canonical sum of products (using minterms) expressions for the truth table below:

| A | B | C | OUT |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 |

$\operatorname{SOP}($ minterms $)=\bar{A} \cdot \bar{B} \cdot \bar{C}+\bar{A} B \bar{C}+A \bar{B} \bar{C}$

| Switches and Wires |  |  |
|  |  |  |

Karnaugh Maps:
6) ( 15 points) Part A: For the following expression, derive a simplified sum of products expression using a Karnaugh Map. Circle and list ALL the prime implicants, indicating which are essential.

$$
\bar{A} \bar{B} \bar{C} \bar{D}+\bar{A} B \bar{C} \bar{D}+\bar{A} \bar{B} C D+A \bar{B} C D+A B C D+A B C \bar{D}+A B \bar{C} \bar{D}
$$

Part B: (10 points) There may be more than one correct answer. For full credit, show ALL additional possible correct simplified sum of products answers (if there are any). Show your work!

ALL POSSIBLE CORRECT ANSWERS ARE:

$\overline{B C D}+\bar{A} \bar{C} \bar{D}+A B \bar{D}+A C D$

$\bar{D} \quad D \quad \bar{D}$

$$
\overline{B C D}+\bar{A} \overline{C D}+A B \bar{D}+A B C
$$

$$
\overline{B C D}+\bar{A} \overline{C D}+\overline{B C} \bar{D}+A B C
$$
